Appendix E: Example of Beverage Attribute Calculations

If a beverage is not “RTD” (ready-to-drink), then a post mix yield needs to be calculated. The post-mix yield is the number of ounces that would typically be produced by the amount of syrup or powder based on the manufacturer’s instructions. This is calculated by multiplying the number of ounces in a container by the number of containers in the pack by the number of “parts” that one “part” of the product will yield. Some items clearly note that a product has a mix ratio. For syrups (i.e. Torani, Monin, ...) that do not have a specific mix ratio noted then it is assumed that 1 oz of product will yield 12 ounces of finished product.

Item Number	Brand	Item Desc	Pack	Size
6080667	TORANI	SYRUP ITALIAN PASSION FRUIT	12	750 ML

Product Information for Torani Syrup:
Product Group = 1C, Misc. Code = BEV05
Serving size = 1oz. Calories/Serving = 80, Total Sugars/Serving = 19
Calories per FO = 80 calories/1oz = 80
Caloric sweetener grams per Fluid Ounce (FO) = 19/1oz = 19
Post mix yield = 25.36 oz (750ml) x 12 pack x (ounces that 1 ounce makes) = 3651.84
Container Type = PETPLAS

Conversions: Milliliter to Ounce
1 ML = 0.033814 oz
1 oz = 29.5735 ML

Example:
750 ml / 29.5735 = 25.36 oz

Conversions: Post mix yield
Example1: Generic finished product ounces
Item size = 750 ML
Items in pack = 12

1 oz produces 12 oz of finished product (no clear ratios indicated for finished ounces)
1. Convert 750 ML to 25.36 oz

New Items Report Review Process Checklist

2. Multiply 25.36 oz by the number of items in the pack which is 12
 - a. $25.36 \times 12 = 304.32$
3. Multiply 304.32 by ounces of finished product which is 12
 - a. $304.32 \times 12 = 3651.84$

Example 1: Items with clear mix ratios

Item size = 750 ML

Items in pack = 12

1 ounce of product makes 6 ounces of finished product.

- Convert 750 ML to 25.36 oz
- Multiply 25.36 oz by the number of items in the pack which is 12
- $25.36 \times 12 = 304.32$
- Multiply 304.32 by ounces of finished product which is 6
- $304.32 \times 6 = 1825.92$

Example 2: Items with clear mix ratios

Item size = 48 oz

Items in pack = 6

3 ounces of product makes 12 ounces of finished product.

- Convert to show what 1 ounce would make. (12oz finished, divided by 3oz of concentrate = 4oz of finished product per 1oz of concentrate)
- Multiply 48 oz by the number of items in the pack which is 6
- $48 \times 6 = 288$
- Multiply 288 by ounces of finished product which is 4
- $288 \times 4 = 1152$

***You can use Google to find conversions for whatever you need, ml to oz, lb to oz, etc...
